

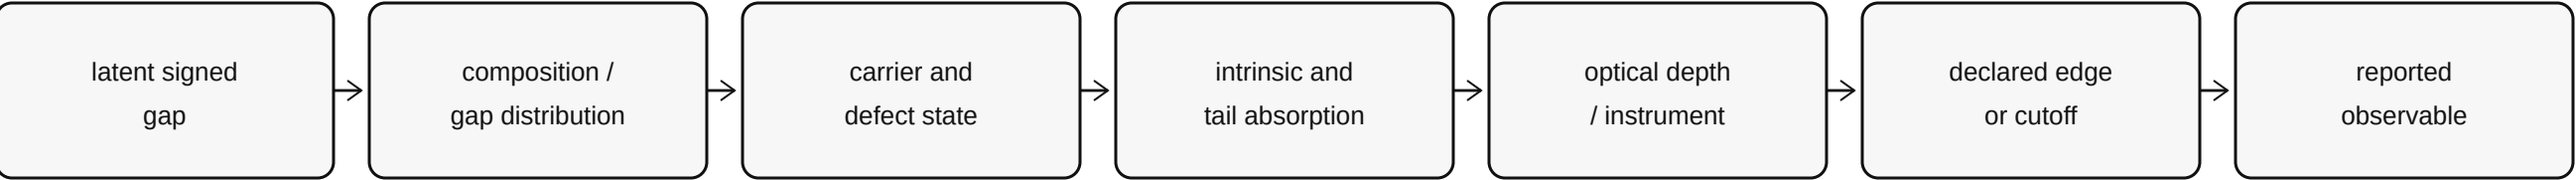

Figure 1. From latent bandgap to reported HgCdTe observable

Forward-model layers and manuscript evidence classes

Evidence state is part of every claim

exact theorem	algebraic result under declared assumptions
numerical verification	deterministic check of theorem or bounded consequence
source reproduction	published convention reproduced under source limits
bounded synthetic sensitivity	illustrative parameters; not a specimen fit
external material validation	calibrated real specimen with sufficient provenance

Central inference rule

A reported edge is an output of the chain.

It is not automatically $E_g(\text{mean } x, T)$.

Exact null directions require external information,
not merely higher signal-to-noise.
